

Sharing Data Allocation Across Mobile Services

What Is Data Sharing?

Data sharing allows multiple mobile services under the same account to access a shared pool of data, instead of each service having its own separate data allowance. This is often used by families or businesses to manage and optimise data usage more efficiently.

Does SpinTel Support Data Sharing?

At this time, SpinTel does not support data sharing between mobile services. Each mobile service with SpinTel has its own individual data allocation, based on the selected plan. This means that data included in one mobile service cannot be transferred or shared with another service under the same account.

Managing Data on Individual Services

While data sharing isn't available, you can still manage your usage effectively by:

- *Tracking your data in real-time* via My Account
- *Setting up usage alerts* to avoid exceeding your data allowance
- *Upgrading or downgrading plans* to better suit your needs
- *Purchasing data blocks* if you run out before the end of your billing cycle

Need More Data Flexibility?

If you're managing multiple services and find that your data needs vary from month to month, consider reviewing your current plans. You can log in to [My Account](#) to compare available plans or reach out to our [support team](#) for personalised recommendations.
